Subject: 2013MY and beyond Sedan Police Interceptor and Utility Police Interceptor

The calibrated speedometer head assembly accuracy in the Sedan Police Interceptor and Utility Police Interceptor vehicles is +/- 2 miles per hour (+/- 3 kilometers per hour) over the entire range (at 70 degrees Fahrenheit or 21 degrees Celsius). The "certified calibration" applies to the head assembly. End user maintenance is critical to accuracy of the indicated speed of the total system, which is affected by the variation in vehicle loading, tire inflation, tire wear, tire rolling radius and driveline ratios.

Accuracy of the speedometer display head in the Sedan and Utility Police Interceptors is expected to maintain its accuracy over the useful life of the vehicle.

Randy Freiburger

A handwritten signature in cursive script that reads "Randy Freiburger".
